

The Job “Happy Path”

Client setup → final invoice & payroll — the least-manual-input flow

The whole idea: front-load the setup. Get the rate card, the job's **days / shifts / crew needs**, and the **crew assignments** right once, and everything after becomes a **one-button “generate from” action** plus a quick **review & approve**. Crew leaders and admins stop typing numbers — the crew enter their own hours in the staff app.

1	Create the client One-time setup, reused on every future job.	SETUP
2	Create / assign the rate card The most important setup step. Define positions & specialties and their bill + pay rates carefully — every quote, invoice and payroll run downstream inherits from this card.	SETUP
3	Create the job Attach the client and the rate card. (Nav calls this “Jobs.”)	SETUP
4	Set up the job — Days, Shifts & Crew Needs Three inputs on the job screen, and the heart of the whole thing: • Days — flag holidays (drives 2× pay automatically). • Shifts — e.g. Load In, Show. • Crew Needs — position × specialty × qty × hours per day. This is what the quote is built from.	SETUP
5	Add crew assignments — spreadsheet import Different from Crew Needs. Crew Needs = how many roles (feeds the quote); Assigned Crew = the named people per day/shift (feeds timekeeping). Import the roster spreadsheet to fill them all at once.	1-BUTTON
6	Generate the quote Built from Crew Needs — no manual line entry. Holiday days carry the 2× badge through automatically.	1-BUTTON
7	Repeat 4–6 until accurate Structured loop: Revise → Sync from Job → Issue Revision (the prior quote auto-supersedes). Iterate until the customer signs off.	
8	Issue the deposit invoice Generate Deposit off the issued quote when a deposit is required.	1-BUTTON
9	Generate timekeeping from crew assignments Add Crew from Job seeds one row per assigned person × day × shift — no roster re-entry. (Needs step 5 done first.)	1-BUTTON
10	Crew enter their own time (staff app) Crew log actual hours in the staff app, off the crew leader's plate entirely — they review instead of type.	CREW APP
11	Approve the timekeeping — the one human gate Lead/admin Submit + Approve the rows. This is the deliberate checkpoint: only approved entries flow into invoices and payroll. Bulk-approve from Pending Review.	REVIEW
12	Generate the final invoice from timekeeping Generate Final , then Overwrite from Timesheets — approved hours flow in and the deposit auto-applies to the balance.	1-BUTTON
13	Repeat 12 until final Reconcile / regenerate as more actuals are approved, until final.	
14	Create the payroll run Pulls the same approved timekeeping entries; pay rates resolve from the employee override or the rate-card pay columns.	1-BUTTON

15

Record payments — deposit & final

Apply payments received against the deposit and final invoices as they come in; status auto-flips to paid.

REVIEW

Where the effort actually goes**SETUP**

Do it once, do it right. Steps 1–5. The only place real thinking is required — rate card, holiday day-flags, shifts, crew needs and crew assignments drive everything downstream.

1-BUTTON

Generate-from actions. Quote, deposit, timekeeping seed, final invoice, payroll run — each is produced from the prior step, not typed.

CREW APP

Offloaded to the crew. Actual hours come from the crew in the staff app, so the crew leader reviews instead of entering timekeeping.

REVIEW

Review & record — the human gates. Approve timekeeping (only approved entries flow onward) and record payments as they arrive.

Bottom line: set up the job's days/shifts/crew needs and the crew assignments correctly, and the crew leader & admin workload collapses to a one-button flow plus two review gates — approving timekeeping and recording payments — with the timekeeping actuals handled by the crew themselves.
