

Timekeeping Guide

For Crew Leads & Admins

How crew scheduling, time entry, and approval fit together after the V2 update.

1. The big picture

Timekeeping now connects three things that used to be separate: the **job** (and its quote/rate card), the **crew assignments** for each day, and the **actual hours** worked. The crew lead builds the day's roster in the Timekeeping screen; crew members can fill in their own actual time from the Staff App; and the crew lead/admin approves it. Because each entry is linked to the job, the correct **bill rates are pulled automatically from the job's quote** — so an entry arrives fully priced and an approver only needs to confirm it.

- **One timesheet per job.** Every crew member's daily rows live on that job's timekeeping sheet.
- **Rates are automatic.** Bill rates (and OT/DT thresholds, holiday multiplier) come from the job's most recent quote — no one types them in.
- **The Staff App and the Timekeeping screen share the same data.** A change in one shows up in the other.

2. The end-to-end flow

1	Build the day	Crew lead adds the crew for each day on the Timekeeping screen (Add Crew from Job, or + Add Crew Member).
2	Print the sign-in sheet	Print / export the day's timesheet as the physical sign-in sheet for the job site.
3	Capture actual time	Either the crew member enters their own actual time in the Staff App, or the crew lead types it on the Timekeeping screen.
4	Crew marks done	In the Staff App, the crew member checks "I'm done" when their time is final (optional but helpful).
5	Review & approve	Crew lead/admin reviews each row and approves. Approval locks the row.
6	Flows to payroll	Approved hours feed the labor summaries used by invoices and payroll.

3. Crew Lead — building the day

On the Timekeeping screen, pick the Job, then add crew with either button:

- **Add Crew from Job** — pulls everyone already assigned to the job's days, each pre-filled with their date, shift, position and specialty. Best for a planned roster.
- **+ Add Crew Member** — add one person on the spot. Pick the **work date** in the dialog (it defaults to the day you have open), then the person. The row lands on that day.

Each added row is a **planned record**: it sits on the job's timesheet ready for actual times. Use **Print / Export** to produce the physical sign-in sheet, and **Hide Bill Columns** when sharing a view with someone who shouldn't see billing.

4. Crew Member — entering time in the Staff App

- **Shifts needing your time** on the home/Timesheets screen lists the planned shifts that still need actual time.
- Tapping **Enter time** opens the entry: pick the real Time In/Out (a split shift has a second pair), meal breaks, and confirm position/specialty/shift.
- If reassigned on-site, the crew member can change position/specialty/shift, or add a separate entry for the extra role.
- When finished, they check **"I'm done"**. This is an advisory signal to the crew lead — it does **not** lock the entry; it can still be edited until approved.

Crew don't see billing dollars — only their hours. Rates and totals are computed behind the scenes from the job's quote.

5. Reviewing & approving

- Staff-submitted entries that aren't yet on the sheet appear in a **"Staff Submissions Pending Review"** card at the bottom of the job's Timekeeping screen — with Approve / Reject buttons.
- Entries already on the sheet that a crew member finalized show a green **"Staff done"** marker; the day header shows a **"staff-finalized" count**.
- Use the **"Staff time" filter** (All / Awaiting staff / Staff done) to narrow the grid to who still hasn't finalized.
- Approving attaches the entry to the job's timesheet and **locks it**. To change an approved entry, unlock it (set back to submitted) first.

6. Rules worth knowing

Required to approve

- **Shift** is required to approve when the job has shifts defined (payroll groups daily rules by shift).
- **Specialty** is required to approve when the position has specialties (payroll resolves the pay rate by specialty).
- These are checked at **approval** time, not when the row is created. The Staff App asks for them up front, so staff submissions arrive complete.

Pricing & locking

- Bill rates, OT/DT thresholds and the holiday multiplier are snapshotted from the job's **most recent quote** — the same source the invoice uses.
- “I’m done” (staff finalized) is advisory and never locks an entry. Only **approval** locks it.
- An approved entry that's been pulled onto an invoice is double-locked until the invoice line is unlinked.

7. Proposed roadmap (not yet built)

Sections 1–6 are live today. The items below are proposed and sequenced. Phase 1 closes the loop with crew and is well defined. Phase 2 (QR / on-site clock-in) still needs design before it's workable.

Phase 1 (next) — close the loop with crew

Assignment notifications + auto login

- When a crew member is **confirmed** for a job (or a timekeeping row is added for them), send an **email and/or SMS** with the assignment (job, date, call time, role).
- The message includes a **link to the Staff App** and their **username**.
- If they don't yet have a Staff App login, **create one automatically** and include the password in the message.
- Result: the crew member opens the app, sees the shift under “needing your time,” and enters their hours — the loop is closed end to end.

Spreadsheet crew load

- Load crew assignments for a job from a **spreadsheet**. On confirmation, anyone without a login gets an account created and the same assignment notification.
- When the job starts, they enter their time in the Staff App like everyone else.

Phase 2 (needs design) — QR / on-site clock-in

Connor asked about a **QR-code clock-in/out** on job sites feeding straight into timekeeping. It's a good goal (fast, objective, real-time capture), but a bare QR code can't stand on its own — it needs to be spec'd out first. The open questions:

- **Who scanned?** A single shared QR can't identify the person — so it still needs a login / per-employee identity. That largely lands back on the Staff App.
- **Which record?** A QR doesn't know which job / day / shift / row to open, or **whether this scan is a clock-in or a clock-out** — it has to map to the right planned timekeeping entry and track in-vs-out state per person per shift.
- **Keep the structure.** Punches must still resolve position / specialty / shift and route through **approval** — they should feed the existing entry, not bypass it (or billing/payroll accuracy is lost).
- **Hardware?** A shared site kiosk vs. each person's own phone changes the whole design.

Likely workable shape: the QR becomes a **deep link** that opens the correct shift's clock-in screen in the Staff App — identity from the person's login, one tap to stamp in/out, feeding the same structured entry and approval we already have. That keeps the convenience of “scan to clock in” without a separate, blind timestamp system. To be designed and confirmed before any build.

Sections 1–6 describe the system as built today. Section 7 is proposed and subject to change.
